Location Date/Time Deaths & **Event Type and Details** Property & Injuries Crop Dmg A National Weather Service storm survey confirmed a strong, long-tracked tornado that first touched down northwest of Adairville near the intersection of Vick Road and State Highway 96, where a barn sustained roof damage and another outbuilding was destroyed. This tornado had a 14 mile long track, 9 of which was in Logan County. Overall, this tornado stayed on the ground for 29 minutes. Damage consistent with a high-end EF-2 tornado was surveyed from near State Highway 96 to just west of the Logan Simpson County line. The worst damage occurred to the north- northeast of Adairville, where the twister crossed Highway 663. Several homes suffered extensive damage. Three people were injured while taking shelter in the bathroom of one home. A fourth injury occurred at a residence along Trimble Road. The tornado weakened as it crossed into Simpson County just north of the intersection of Conn and Reames-Dixon Roads SIMPSON COUNTY --- 2.6 NW PRICES MILL [36.71, -86.75], 1.6 S NEOSHEO [36.70, -86.67] 06/10/13 13:00 CST 2K Tornado (EF1, L: 4.87 mi, W: 200 yd) 06/10/13 13:09 CST 5K Source: NWS Storm Survey A strong, long tracked tornado, which first touched down in Logan County, continued in Simpson County. The complete track of this twister was just over 14 miles, with the last 4.8 miles in Simpson County. Earlier, EF-2 damage was surveyed in Logan County, but, by the time it crossed into Simpson County near the intersection of Conn and Reames-Dixon roads, it had weakened to an EF-1. Several outbuildings and trees were damaged in Simpson County before the tornado lifted along Russelville-Gallatin Road. Overall, 5 homes in both Logan and Simpson Counties sustained extensive damage, with two other residences suffering minor damage. Five grain bins were destroyed. SIMPSON COUNTY --- 1.3 ENE FRANKLIN WHAK ARPT [36.73, -86.61] 06/10/13 13:06 CST 0 Hail (1.75 in) 06/10/13 13:06 CST 0 Source: Trained Spotter This hail fell from the supercell thunderstorm that earlier produced an EF-2 tornado well to the west of Franklin. 06/10/13 15:15 CST	0	Thunderstorm Wind (EG 52 kt)
06/10/13 15:15 CST	0	Source: Trained Spotter

A spotter reported several trees down in Greensburg.

An upper level low was located over Indiana during the early afternoon hours on Monday, June 10th. Broad cyclonic flow aloft south of this feature brought brisk westerly mid and upper level winds to southern Kentucky and Tennessee. Despite relatively weak instability and moisture availability, cool temperatures aloft and steep mid-level lapse rates lead to the development of several low-topped supercells across the southern portions of the Commonwealth and central Tennessee. One supercell developed just to the south of Russellville, spawning large hail and a strong tornado.

06/27/13 01:15 EST 0 Flash Flood (due to Heavy Rain)

06/27/13 01:15 EST 0 Source: Public

The public reported water over Doylesville Road near Clear Creek. This quickly flowing water was around one half foot deep.

Multiple rounds of convection developed on June 26th across southern Indiana, sliding southeast into north central Kentucky. In all, three episodes of heavy thunderstorms contributed to localized flash flooding across north central Kentucky, including Louisville, Lexington, and in Madison County. The last two episodes, arriving during the late-afternoon and late-evening hours, brought wind damage, flooding and one long-tracked strong tornado in LaRue County. At the beginning of the day, Kentucky lay in a very humid airmass, with dewpoints in the lower 70s. During the pre-dawn hours, the remains of a decaying nocturnal mesoscale convective system brought widespread substantial rains to Louisville and areas eastward along and north of Interstate 64 towards Frankfort. Some areas in metropolitan Louisville received over 1 inch of rain. This convective system didn't penetrate very far into Kentucky before dissipating, leaving an undisturbed airmass for later in the afternoon. A second wave of storms moved southeast across the same area during the mid-afternoon hours. These were surface-based and brought localized flash flooding and wind damage. The final round of storms moved southeast of the Ohio River near and southwest of Louisville around mid-evening, supported by a strong digging shortwave moving southeast across Illinois. This final round of storms brought additional flash flooding, damaging winds, and a tornado.
